

Fig. 1. Male genitalia of *Saileria irrorata*. a) left paramere. b) right paramere. c) aedeagus.

Tropidostepes adustus superficially resembles *rufusculus* Knight but is considerably smaller and glabrous. In Froeschner (1949) *adustus* keys with *amoenus* Reuter but can be separated by the distinctly punctured frons, the fuscous spots on the calli, the 2 parallel brown lines on the scutellum, and the smaller size. Pennsylvania specimens ranged in length from 3.75-4.17 mm (\bar{x} =3.95, n=10) in ♂♂ and 4.08-4.67 mm (\bar{x} =4.23, n=10) in ♀♀.
