This paper deals with three new species of *Halticus* Hahn from China. All measurements in descriptions are in mm. Type specimens are deposited in the Department of Biology, Nankai University, Tianjin.

Halticus maculipes sp. nov. (figs. 1, 2)

Blackish-brown. Posterior margin of vertex, juga and inner margin of eyes orange. Clypeus and gena prominent. Antennae ochraceous, slender, longer than the body, apex of segment II, distal 4/5 of segment III and segment IV fuscous. Pronotum smooth,

Male claspers as shown in figs. 1, 2.

Holotype ♂, allotype ♀: Sichuan (Ya'an), 4. VII. 1963, collected by Zou Huan-guang. Paratypes 9 ♀♀ 15 ♂♂, Sichuan (Ya'an, Baoxing, Xichang, Mt. Emei, Mt. Qing-cheng), Hubei (Wuhan).

Similar to *Halticus comitans* Josifov et Kerzhner, but the length of antennal segments different, ventral side of hind femora with a row of irregular black spots, and male genital claspers different (figs. 1, 2, 7, 8). Also close to *Halticus bicoloratus* Kulik, but body blackish-brown, not elliptical in form, male genital claspers different (figs. 1, 9).

Halticus niger sp. nov. (figs. 3, 4)

Head, pronotum, scutellum, fore wings, pectus and abdomen black. Antennal segment 1, basal 4/5 of segment II, extreme basis of segments III & IV ochraceous, distal 1/5 of segment II, most parts of segments III & IV fuscous. Pronotum and hemelytra shining, with ochraceous, declined pubescence. Costal margin weakly bending forward at middle. Apex of cuneus ochraceous. Membrane fuscous, surpassing apex of abdomen, basal part grey. Legs ochraceous, hind femora thick, two black spots near the apex, one on the exterior side, the other on the dorsal side; interior side of the basal half of hind femora blackish-brown, without black spot inner apically; apices of tarsi and claws black. Total length 2.80, maximum width 1.40, head height 0.70, head width 0.65, interocular space 0.40, rostrum length 1.10, antennal segments length I:II:III:IV=0.30:1.40:1.10:1.20. This species is similar to *Halticus comitans* Josifov et Kerzhner, but much darker in colour, head entirely black, basal interior side of hind femora blackish-brown. Male genital claspers different (figs. 3, 4, 7, 8). It is also similar to *Halticus maculipes* sp. nov. in appearance and colouration, but head entirely black, thoracic sterna black, hind femora without a row of black spots on ventral surface, basal part of hemelytral membrane grey, male genital claspers distinctly different.
