

AGALLIASTES DECOLOR Uhler. Two specimens of this inconspicuous little species were collected near Cape St. Lucas by Mr. John Xanthus.

PSALLUS DELICATUS Uhler. Several specimens were collected at the Calmalli mines in April by Mr. C. D. Haines.

PSALLUS BIGUTTULATUS n. sp.

Yellowish-white, milk-white on the membrane, with two small angular black spots on its exterior border; the surface finely pubescent. Head subtriangular as seen from above, smooth, yellow, moderately convex, directed obliquely, the eyes long, brown, placed almost vertically; the tylus parallel-sided, a little curved; antennæ short, slender, black, the basal joint short, white, with a subapical band and exterior stripe black; rostrum testaceous, tinged with fulvous, reaching between the intermediate coxæ. Pronotum wider than long, moderately convex, the lateral margin sinuated, reflexed, the anterior margin very delicately reflexed and notched in the middle, the outer border of the callosities posteriorly with an indented line, humeral angles subacute, a little granulated, bordered inwardly by a depression, the posterior margin almost straight. Scutellum almost flat, a little punctate, and obsoletely carinate on the middle line. Legs whitish-yellow, with a very slender black line on the femora and tibiæ. Clavus and corium obsoletely punctate in longitudinal series. Beneath whitish, unpolished.

Length to tip of venter $3\frac{1}{2}$ mm. Width of pronotum $1\frac{1}{4}$ mm.

Specimens were collected at the Calmalli mines in April, at El Paraiso in May, and on Margarita Island in March by Mr. C. D. Haines. The antennæ are incomplete in all the specimens examined.
