

*PSALLUS GUTTULOSUS* Reuter. One specimen, No. 804, was taken at San Fernando in May by Mr. C. D. Haines.

*PSALLUS* n. sp.?

Two specimens, No. 307, from Comondu, March, were collected by Mr. C. D. Haines. The condition of the insects would give only misleading characters for description.

Several other species related to *Psallus* are in the collection from Lower California, but they do not furnish proper material for description.

A most interesting and peculiar type of Capsid, related to *Pilophorus*, is in the collection and labeled "Cal. 9." It seems important to add a description of it in this article, since the same insect, or one much like it, was collected in Lower California by Mr. John Xanthus.

*MYRMECOPSIS* n. gen.

In form much resembling the common black *Formica* which inhabits the wood of trees in the eastern United States. Head long, thick, almost vertical, much thicker than the swollen middle of the pronotum; the front continuous with the vertex, and both occupied by a broad ridge down the middle, which grows obsolete below the line of the antennæ, the tumid head growing narrower behind the eyes and ending in a short and much contracted neck, the face wide to the base of the tylus, conical below that line; eyes large, placed nearly vertical, prominent above and laterally; antenniferous basal support starting slender below the middle of the eye and projecting to near the lower line of the eye; the basal joint of antennæ reaching almost to the tip of the tylus, the second joint clavate towards the tip, as long as from the middle of the eye to the base of pronotum, the third joint abruptly slender; about half as long as the second; ros-
