

## Two new Heteroptera species from Egypt.

R. LINNAVUORI

1. *Psallus (Compsidolon) beduinus* n. sp. (Miridae).

*P. balachowskyi* LINNAVUORI 1964, p. 332 nec WAGNER 1958, p. 209.

Length 2.5 mm. Whitish yellow. Eyes dark brown. 1st antennal joint either infuscate or dark brown with apex and other joints yellow. Scutellum basally orangish. Elytra whitish, faintly irrorate with fuscous on clavus, corium and apical half of cuneus; membrane with faint infuscation. Femora yellowish brown, hind femora apically irrorated with fuscous. Tibiae whitish with dark dots, each dot bearing a pale spine.

A small delicate species. Hair covering of upper surface yellowish. Head 0.7 × as broad as pronotum; vertex 1.6 × as broad as eye. Proportions between the antennal joints 3: 19: ? : ?; 2nd joint 0.8 × as long as basal width of pronotum. Rostrum extending to hind coxae. 2nd and 3rd joints of hind tarsi of equal length. Male genitalia figured by LINNAVUORI (op.cit.).
